

Changelog DDC_V v124

17.06.2020

Features:

- Multicast: The port for the multicast transmission can now be specified in the main config-file (following the multicast-group IP-Address i.e. 224.0.0.255:25000).
If not specified, the default port is 25000.
- Multicast packet: synth_oen field is now 0 for off and 1 for on (was 1 for off and 2 for on)
- Multicast packet: cont_cal_swap (polarity) is now applied to the tp_on, tp_off fields in the multicast packet.
- Correction in Multicast documentation: the field for the BBC frequency does include decimal places, to get the correct frequency value the field has to be divided by 524288.0 (floating point)
- Down Conversion: If the frequency for the down conversion is set to 0 in the config file, the synthesizer is turned off.
